# Fourier-Motzkin

$$t_1 \leq ax, \quad bx \leq t_2$$

$$bt_1 \leq abx, \quad abx \leq at_2$$

$$bt_1 \leq at_2$$

Very similar to Resolution

Exponential time and space

# Polynomial Constraints

AKA  
Existential Theory of the Reals  
 $\exists \mathbb{R}$

$$\begin{aligned}x^2 - 4x + y^2 - y + 8 &< 1 \\xy - 2x - 2y + 4 &> 1\end{aligned}$$

# CAD “Big Picture”

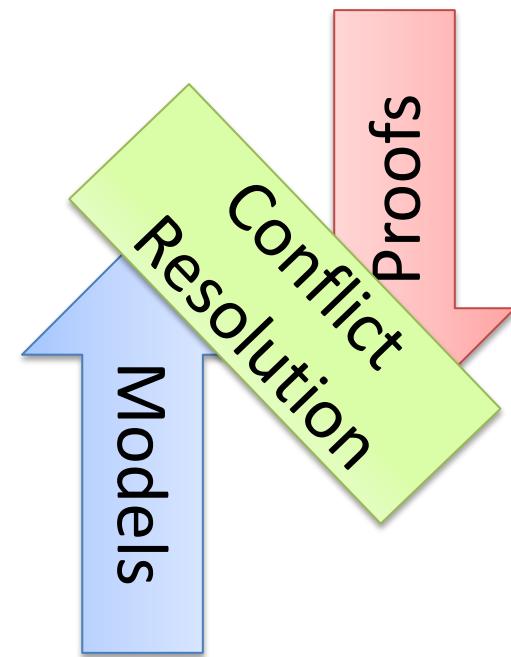

1. **Project/Saturate** set of polynomials
2. **Lift/Search**: Incrementally build assignment  $v: x_k \rightarrow \alpha_k$ 
  - Isolate roots of polynomials  $f_i(\alpha, x)$
  - Select a feasible cell  $C$ , and assign  $x_k$  some  $\alpha_k \in C$
  - If there is no feasible cell, then backtrack

# NLSAT: Model-Based Search

Start the Search before Saturate/Project

We saturate on demand

Model guides the saturation

---------------------	-------------------	----------------	-------------------	--

$$-x + z + 1 \leq 0, \quad x - y \leq 0 \quad z \rightarrow 0, \quad y \rightarrow 0$$

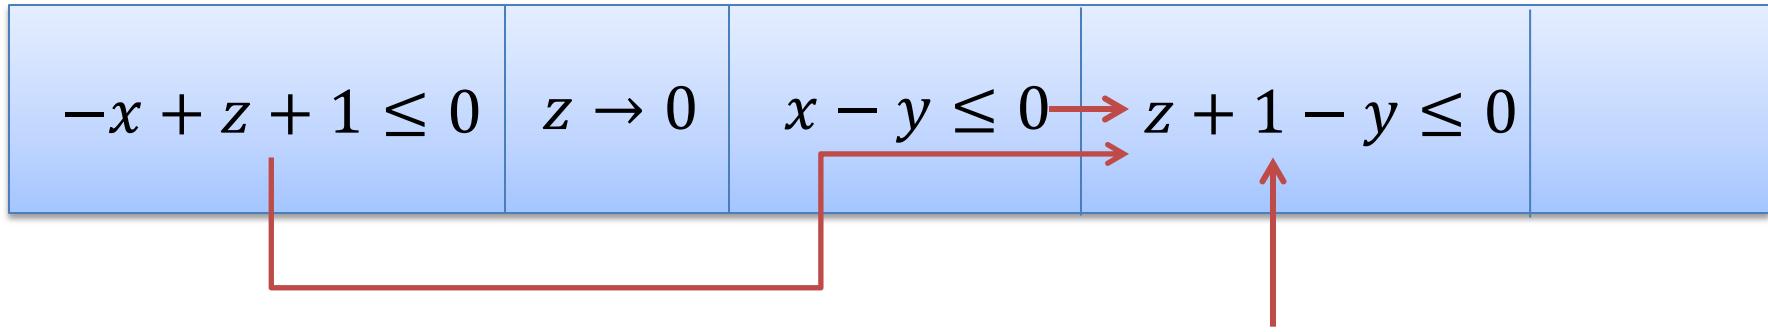

$$\exists x: -x + z + 1 \leq 0 \wedge x - y \leq 0$$

$$z + 1 - y \leq 0$$

Fourier-Motzkin

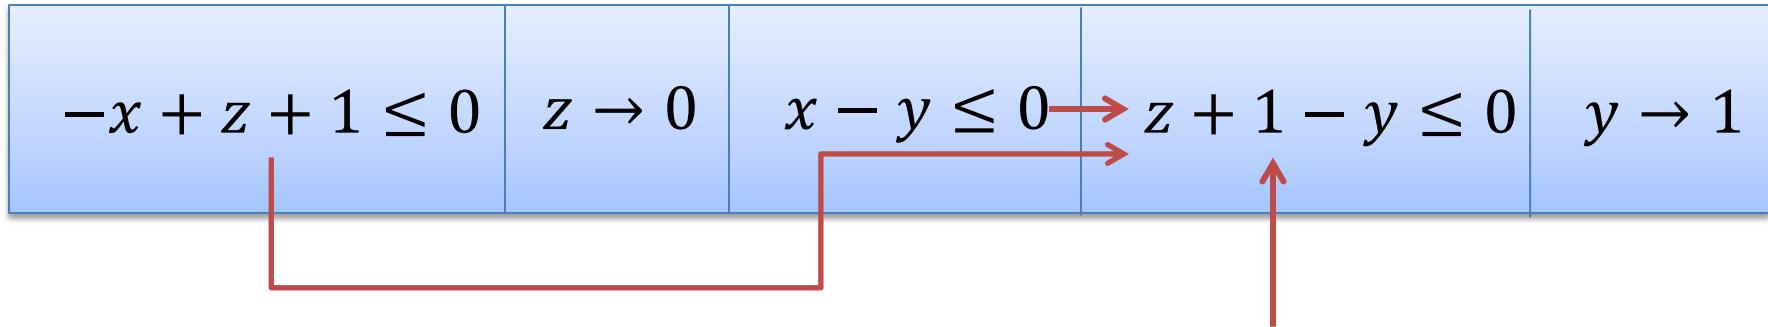

$$\neg(-x + z + 1 \leq 0) \vee \neg(x - y \leq 0) \vee z + 1 - y \leq 0$$

# MCSat: FM Example

$$\neg(-x + z + 1 \leq 0) \vee \neg(x - y \leq 0) \vee z + 1 - y \leq 0$$

# MCSat: FM Example

$$\neg(-x + z + 1 \leq 0) \vee \neg(x - y \leq 0) \vee z + 1 - y \leq 0$$

$$-x + z + 1 \leq 0, \quad x - y \leq 0 \quad \quad \quad z \rightarrow 0, \quad \quad y \rightarrow 1$$

$\equiv$

$$z + 1 \leq x, \quad x \leq y$$

$$1 \leq x, \quad x \leq 1$$

# MCSat: FM Example

$$-x + z + 1 \leq 0$$

$$z \rightarrow 0$$

$$x - y \leq 0$$

$$\rightarrow z + 1 - y \leq 0$$

$$y \rightarrow 1$$

$$x \rightarrow 1$$

$$\neg(-x + z + 1 \leq 0) \vee \neg(x - y \leq 0) \vee z + 1 - y \leq 0$$

$$-x + z + 1 \leq 0, \quad x - y \leq 0$$

$$z \rightarrow 0, \quad y \rightarrow 1$$

$\equiv$

$$z + 1 \leq x, \quad x \leq y$$

$$1 \leq x, \quad x \leq 1$$

# MCSat – Finite Basis

Every theory that admits **quantifier elimination** has a finite basis (given a fixed assignment order)

$$F[x, y_1, \dots, y_m]$$

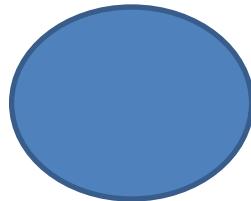

$$\exists x: F[x, y_1, \dots, y_m]$$

$$C_1[y_1, \dots, y_m] \wedge \dots \wedge C_k[y_1, \dots, y_m]$$

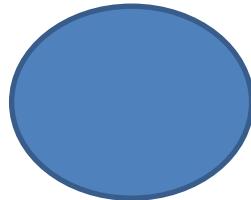

$$\neg F[x, y_1, \dots, y_m] \vee C_k[y_1, \dots, y_m]$$

$$y_1 \rightarrow \alpha_1, \dots, y_m \rightarrow \alpha_m$$

# MCSat – Finite Basis

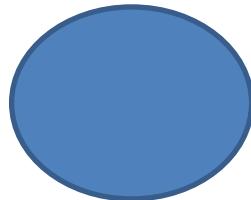

$$F_n[x_1, x_2, \dots, x_{n-1}, x_n]$$

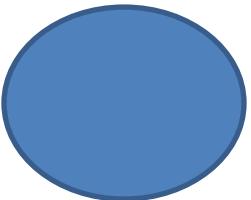

$$F_{n-1}[x_1, x_2, \dots, x_{n-1}]$$

...

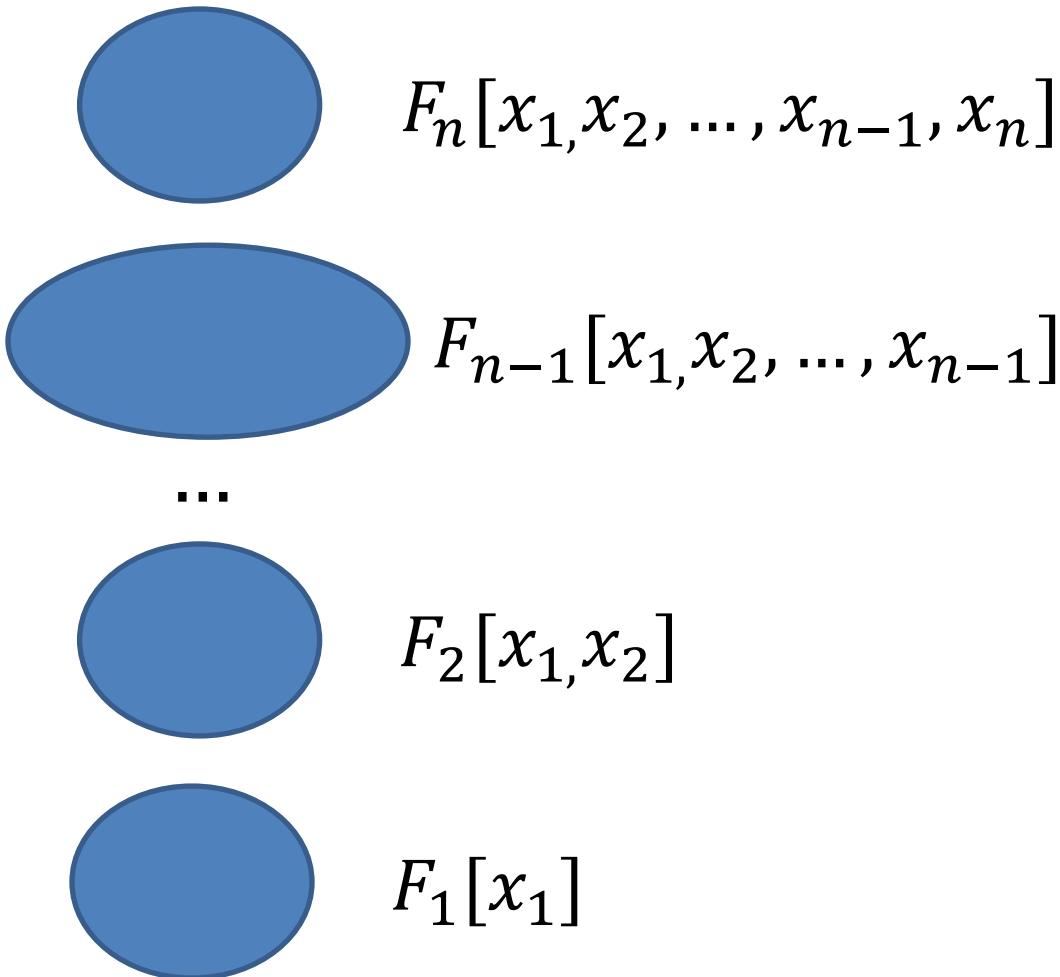

$$F_2[x_1, x_2]$$

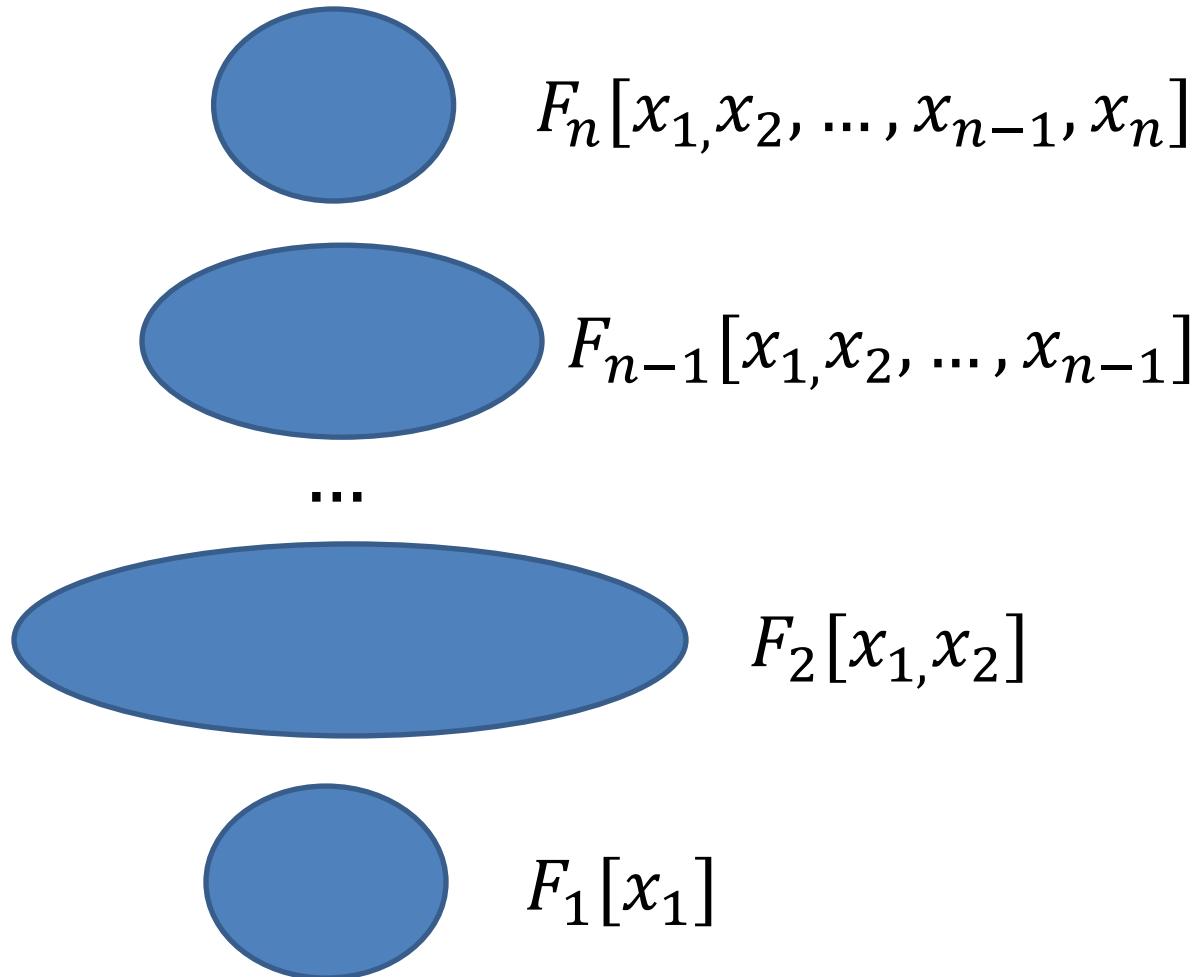

$$F_1[x_1]$$

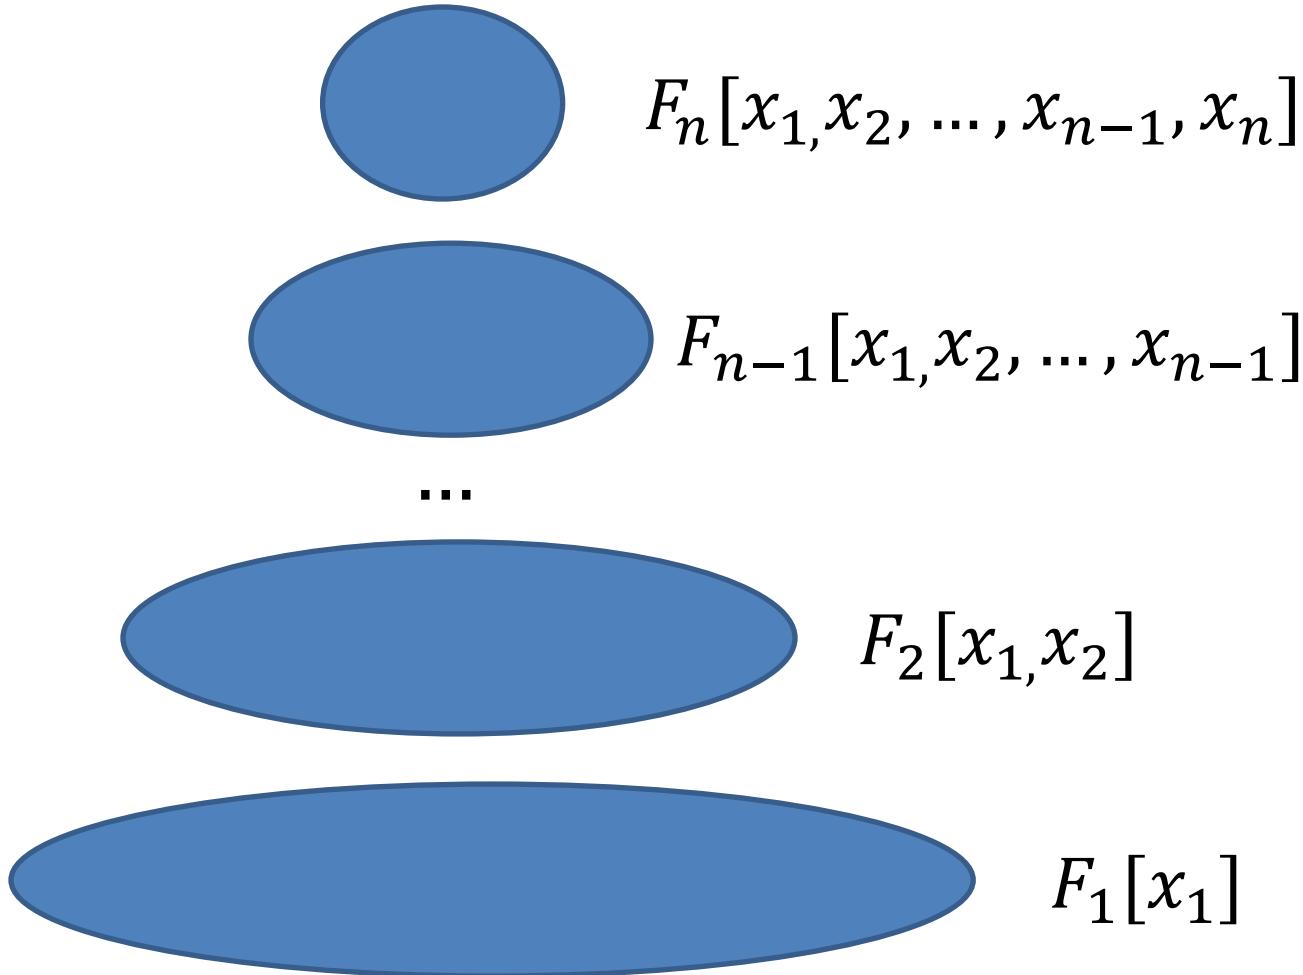

# MCSat – Finite Basis

# MCSat – Finite Basis

# MCSat – Finite Basis

# MCSat – Finite Basis

Every “finite” theory has a finite basis

Example: Fixed size Bit-vectors

$$F[x, y_1, \dots, y_m] \quad y_1 \rightarrow \alpha_1, \dots, y_m \rightarrow \alpha_m$$

$$\neg F[x, y_1, \dots, y_m] \vee \neg(y_1 = \alpha_1) \vee \dots \vee \neg(y_m = \alpha_m)$$

# MCSat – Finite Basis

Theory of uninterpreted functions has a finite basis

Theory of arrays has a finite basis [Brummayer- Biere 2009]

In both cases the Finite Basis is essentially composed of equalities between existing terms.

# MCSat: Uninterpreted Functions

$$a = b + 1, f(a - 1) < c, f(b) > a$$

$$a = b + 1, f(\textcolor{red}{k}) < c, f(b) > a, \textcolor{red}{k} = a - 1$$

$$a = b + 1, \textcolor{red}{f(k)} < c, \textcolor{red}{f(b)} > a, k = a - 1$$

Treat  $f(k)$  and  $f(b)$  as variables  
**Generalized variables**

# MCSat: Uninterpreted Functions

$$a = b + 1, f(k) < c, f(b) > a, k = a - 1$$

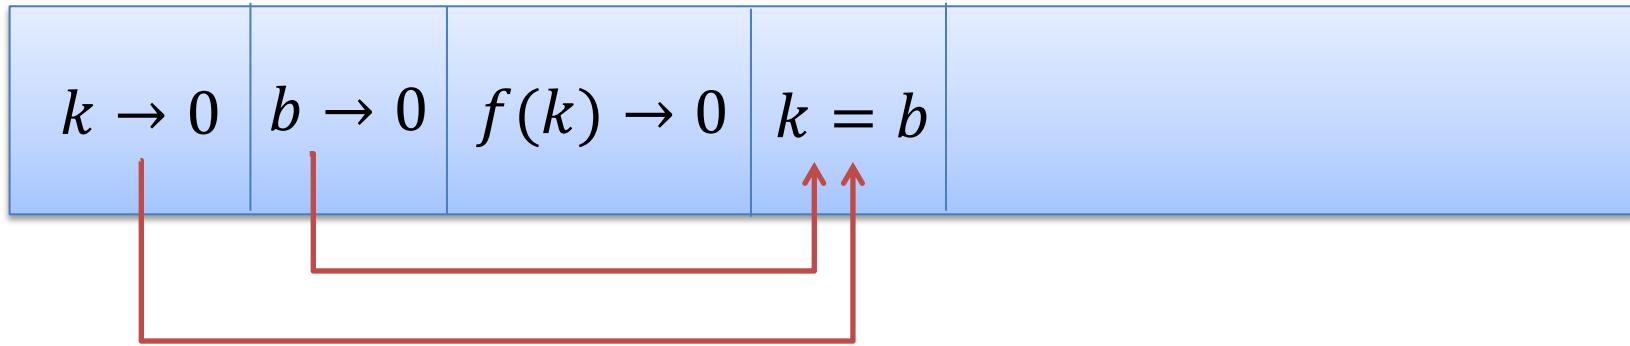

$k \rightarrow 0$	$b \rightarrow 0$	$f(k) \rightarrow 0$	$f(b) \rightarrow 2$	
-------------------	-------------------	----------------------	----------------------	--

Conflict:  $f(k)$  and  $f(b)$  must be equal

$$\neg(k = b) \vee f(k) = f(b)$$

# MCSat: Uninterpreted Functions

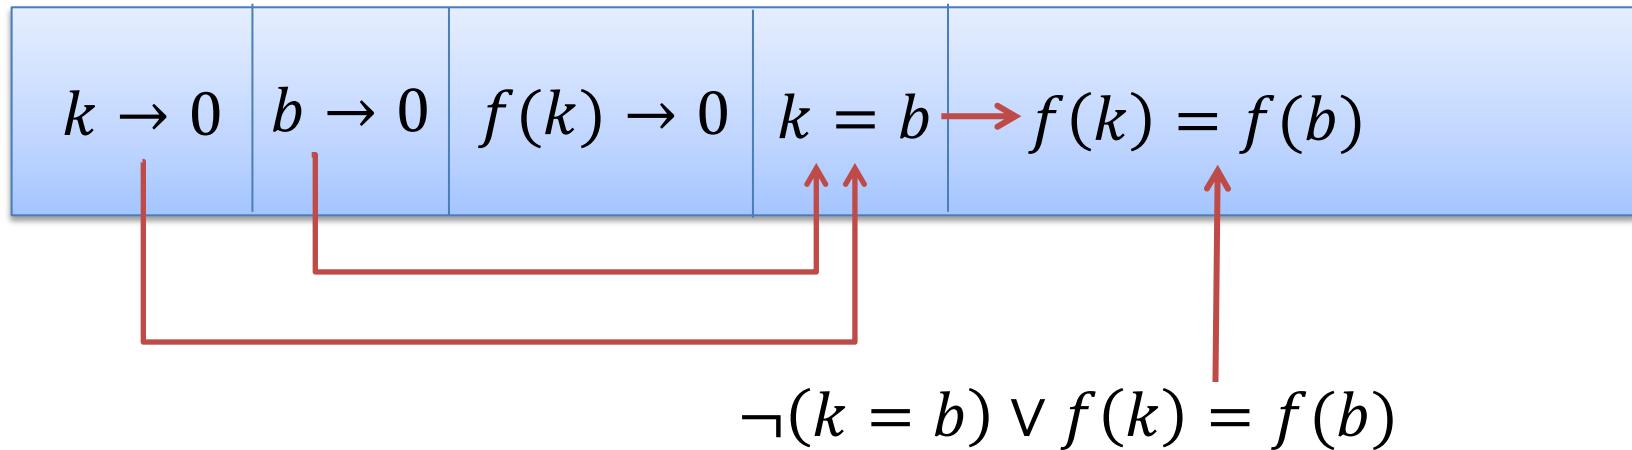

$$a = b + 1, f(k) < c, f(b) > a, k = a - 1$$

$$\neg(k = b) \vee f(k) = f(b)$$

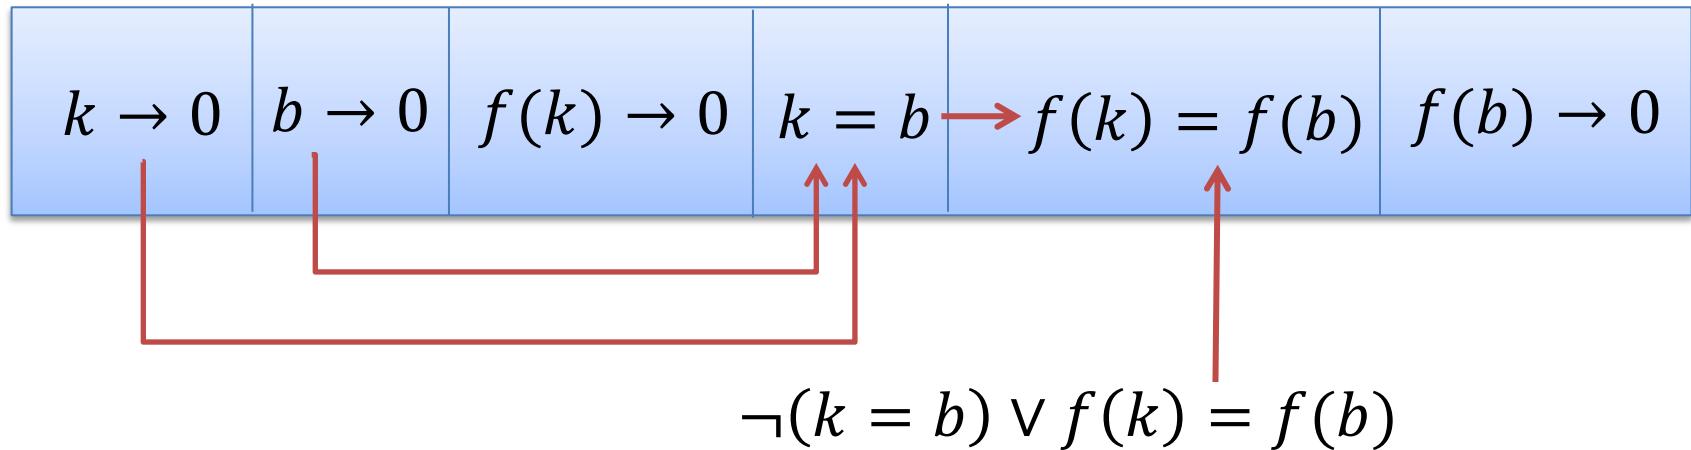

# MCSat: Uninterpreted Functions

$$a = b + 1, f(k) < c, f(b) > a, k = a - 1$$

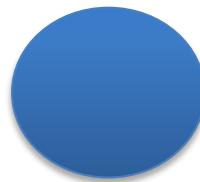

# MCSat: Uninterpreted Functions

$$a = b + 1, f(k) < c, f(b) > a, k = a - 1$$

# MCSat: Termination

UNSAT Core generation

MaxSAT

Interpolant generation

Introduced in MiniSAT

Implemented in many SMT solvers

# Extending Check Modulo Assignment for MCSAT

$$F[\bar{x}, \bar{y}] \quad \bar{y} \rightarrow \bar{v}$$

# Extending Check Modulo Assignment for MCSAT

$$F[\bar{x}, \bar{y}] \quad \bar{y} \rightarrow \bar{v}$$

SAT,  $\bar{x} \rightarrow \bar{w}, F[\bar{w}, \bar{v}]$  is true

# Extending Check Modulo Assignment for MCSAT

$$F[\bar{x}, \bar{y}] \quad \bar{y} \rightarrow \bar{v}$$

SAT,  $\bar{x} \rightarrow \bar{w}$ ,  $F[\bar{w}, \bar{v}]$  is true

UNSAT,  $S[\bar{y}]$  s.t.  $F[\bar{x}, \bar{y}] \Rightarrow S[\bar{y}], S[\bar{v}]$  is false

# NLSAT/MCSAT

$$F[\bar{x}, \bar{y}]$$

$y_1 \rightarrow w_1$	$\dots$	$y_k \rightarrow w_k$	
-----------------------	---------	-----------------------	--

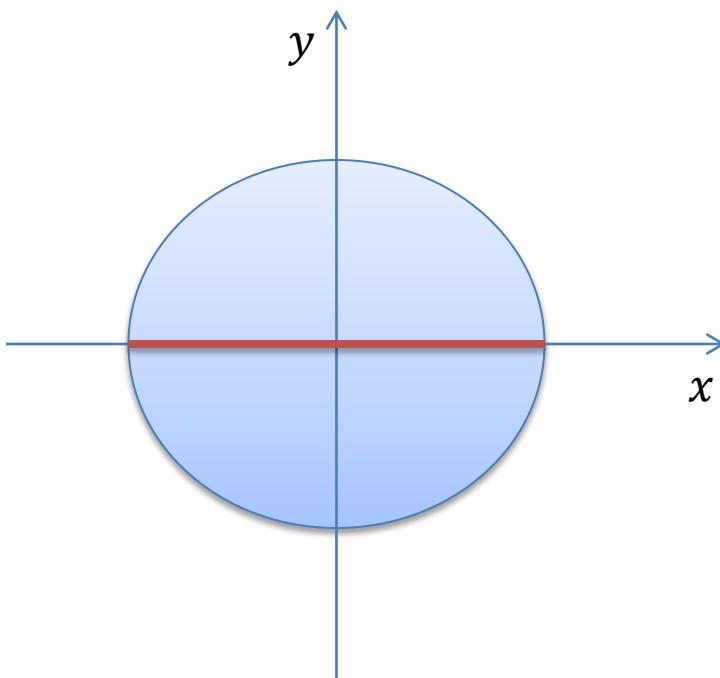

# NLSAT/MCSAT

*Check*( $x^2 + y^2 < 1, \{y \rightarrow -2\}$ )

# NLSAT/MCSAT

$\text{Check}(x^2 + y^2 < 1, \{y \rightarrow -2\})$

**UNSAT,  $y > -1$**

# No-good sampling

$\text{Check}(F[\bar{x}, \bar{y}], \{ y \rightarrow \alpha_1 \}) = \text{unsat}(S_1[\bar{y}]), \quad G_1 = S_1[\bar{y}],$

$\alpha_2 \in G_1, \quad \text{Check}(F[\bar{x}, \bar{y}], \{ y \rightarrow \alpha_2 \}) = \text{unsat}(S_2[\bar{y}]), \quad G_2 = G_1 \wedge S_2[\bar{y}],$

$\alpha_3 \in G_2, \quad \text{Check}(F[\bar{x}, \bar{y}], \{ y \rightarrow \alpha_3 \}) = \text{unsat}(S_3[\bar{y}]), \quad G_3 = G_2 \wedge S_3[\bar{y}],$

...

$\alpha_n \in G_{n-1}, \quad \text{Check}(F[\bar{x}, \bar{y}], \{ y \rightarrow \alpha_n \}) = \text{unsat}(S_n[\bar{y}]), \quad G_n = G_{n-1} \wedge S_n[\bar{y}],$

...

**Finite decomposition property:**

**The sequence is finite**

$G_i$  approximates  
 $\exists \bar{x}, F[\bar{x}, \bar{y}]$

# Computing Interpolants using Extended Check Modulo Assignment

Given:  $A[\bar{x}, \bar{y}] \wedge B[\bar{y}, \bar{z}]$

Output:  $I[\bar{y}]$  s.t.

$$B[\bar{y}, \bar{z}] \Rightarrow I[\bar{y}],$$

$$A[\bar{x}, \bar{y}] \wedge I[\bar{y}] \text{ is unsat}$$

# Computing Interpolants using Extended Check Modulo Assignment

$I[\bar{y}] := \text{true}$

Loop

Solve  $A[\bar{x}, \bar{y}] \wedge I[\bar{y}]$

If UNSAT return  $I[\bar{y}]$

Let solution be  $\{\bar{x} \rightarrow \bar{w}, \bar{y} \rightarrow \bar{v}\}$

Check( $B[\bar{y}, \bar{z}]$ ,  $\{\bar{y} \rightarrow \bar{v}\}$ )

If SAT return SAT

$I[\bar{y}] := I[\bar{y}] \wedge S[\bar{y}]$

# Conclusion

Model-Based techniques are very promising

MCSat is a more faithful lift of CDCL than DPLL(T)

Prototypes:

NLSAT source code is available in Z3
